

Category Page Templates (BROK_CTGYTEMPLATES): Adding Tokens to Evaluate Expressions

Is there a token that I can use to evaluate expressions, such as Products.d.price - Products.d.cost?
(2003/07/11)

This feature was added in a recent upgrade (version 4.88 compiled, 4.88 uncompiled). The %var| token will now evaluate and display an expression or variable. For example, to display the price - cost for a product you would use a token of the sort:

```
%var|Products.d.price - Products.d.cost|%
```

With that upgrade I also modified the conditional tokens %begin_if| and %begin_notif| to be able to evaluate expressions. So if, for example, you wanted to display text only if the product has weight of 3, you could use:

```
%begin_if|Products.d.weight EQ 3|%
```

This product has a weight of 3!

```
%end_if%
```
